

Report 07

Individual Contributions

Include a section that describes each startup founder's contribution. Each startup founder should be responsible for at least one product feature and its HTTP route(s). Name the feature and the HTTP routes that the founder updated to use the database.

Each founder must be responsible for converting at least one HTTP route.

- **Vlad Emelyanov:** Converted database from mock db to MongoDB format, performed preliminaries in server/src/server.js, updated GET modal/trip-sums/ and getModalTrips() to work with and access the real database, added helper methods for getFeedItem & getUser
- **James Desjardins:** Converted helper functions for getting recent trips. This is the GET /trips/ path.
- **Matthew Cassano:** Converted updateUser function and the PUT (users/userid)
- **Sean Callahan:** Got usertrip stuff to work with the mock db but not Mongo
- **Alex Sullivan:** Wired up HTTP /full-trip/ requests (currently has async issues). Initialized and installed proper mongodc modules including piazza issue that is pinned

Lingering Bugs / Issues / Dropped Features

If your application has any lingering bugs, issues, or missing/dropped features, include a section listing these.

Similarly, if any particular features or components are not using the database, please mention those features here.

- Didn't get a chance to wire up Google Geolocation API
- The left sidebar has issues with linking to the profile page and sending it data.
- The usergenerated trips don't work with Mongo
- Still working on fully getting PUT/users/userid to work with mongo, but should be fixed before final pull.
