

GET /full-trip/:tripid [trip]

- trip is a JSON object that contains 3 lists that reference JSON Objects of activities, restaurants, and accommodations.
- Creates/returns json object that has all of the trip data. Replaces the getFullTripData() mock data method.
- Authorized: trips are globally available to view (comes up in generated near you feed) and thus one only needs query with the tripid (similar to tweets that are publicly available).

DELETE /full-trip/:tripid/feeditem/:feeditemid []

- Deletes a feeditem from the feeditem collection. This could be a AccommodationItem, ActivityItem, or RestaurantItem. This is an important feature to eventually 'regenerate' a trip, but only deletion is available. Next route would be routes to add an item to a trip.
- Authorized: only authors of the Trip are allowed to delete items (this check is currently hard-coded thus you can delete).
- Note: Use 'reset database' button to get trip information back.
- Located in the top-right hand corner of each item on the fulltrip pages.

GET /modal/trip-sums [tripSums]

- tripSums is a JSON object that contains 3 JSON TripSummary objects
- This route replaced the mock server getModalTrips method
- Authorized: tripSummaries are globally available to view (comes up in generated near you feed) and thus one only needs query with the tripid (similar to tweets that are publicly available).

GET /trips/ [trips]

- Trips is a json object composed of multiple trips included
- This route replaced the getRecentTrips mock server method.
- It's authorized for anyone as it returns a feed of recently generated trips, not exclusive to any one user

GET /users/:userid [userdata]

- Userdata is a json object that contains a single users information
- This route is new and does not replace a past server method, but now relies on the getUser method
- It's only authorized for use of the same user who is calling it, ie. the user must match the userid

PUT/users/:userid[userdata]

- Userdata contains a users information and is a JSON object
- Alters the state of the database for users
- This route is new and relies on the updateUser method
- Authorized: Only user with the specified userid can issue PUT/user

GET /trips/:userid [trips]

- Trips is a json object composed of multiple trips written by a specific user
- This route is new and relies on the getUserTrips method

- Authorized: tripSummaries are globally available to view (comes up in generated near you feed) and thus one only needs query with the tripid (similar to tweets that are publicly available).

Report: Individual Contributions

Alex Sullivan:

- route: "GET /full-trip/:tripid", generates trip from database given an id.
- route: "DELETE /full-trip/:tripid/feeditem/:itemid", deletes activities, accommodations, restaurants from a trip. This does not delete the feeditem from the database.
- Errorbanner - Creates global SHEDError for http issues.
- Wired up sendXHR method, initial repository server/client folders
- Route "/resetdb" implemented server 'reset-database' button.

Vlad Emelyanov:

- route: "GET /modal-trips", described above.
- Fixed Modal, it now displays TripSummary items from the database
- Edited tripsumdb.js to work with Modal

James Desjardins:

- route: "GET /trips/", returns a list of recent trips for display
- route: "GET /user/:userid", returns the users data

Matt Cassano

- Route "PUT/user/:userid", described above.
- Worked on display of the Edit Profile page but could still not get it to render

Sean Callahan

- Route "GET /trips/:userid", returns a list of tripsummaries generated by the user

Report: Lingerin Bugs / Issues / Dropped Features.

- All Trip Summary Items in Modal link to the same page (fullTrip), as we do not have others yet
- Edit Profile page still not rendering but will be worked on extensively upcoming weekend
- Trip summary items in usergenerated aren't pulling from the database properly
