

# 1. Bugs

- For this project. All 'More info' buttons map to the same 'trip' but that is to prevent a massive 'initial data' object.
- The presentation of the Boston picture and title is still hardcoded, this may be removed or implemented as component in future, but decided to keep for now.
- The save button on the edit profile page refreshes the page but doesn't save the data for now.
- Building the list of Recently generated trips on the main page currently is not working correctly so it's removed
- The list of user generated trips on it's page doesn't work either so it is mostly blank.
- Some links are not functional on the main page
- The left side bar doesn't link to a profile, that will be added after
- Modal does not display trip summaries dynamically gotten from the database. Currently displays a dummy trip summary, to simulate the functionality. This will be solved with more extensive debugging.

## Components

- Mainpage.js - The landing page for the website, combines simplegenerate.js and a feed of TripSummary components to introduce the user to what kind of trips they want to view.
- simplegenerate.js - A component of the mainpage, allows a simple input of a start date and end date and creates a basic trip for the user.
- leftsidebar.js - The left sidebar. Includes basic information of the user.
- customize.js - Page that allows for customization of user preferences, and more relevant trip results
- rightsidebar.js - The right sidebar which displays a list of 'activityitems' near your location
- Modal.js - a modal that pops up when trips are initially generated with a list of 3 'tripssummary' items.
- User.js - Implementation of the profile information based off the edit profile page.
- Activityitem.js - basic implementation of an activity item for the right sidebar. May be scrapped soon
- Tripsumdb.js - an attempt to make trip summaries work with the database (either this file or tripsummary.js will eventually be scrapped)
- Tripsummary.js - the first attempt at making trip summaries not completely hardcoded.
- Usergeneratedpage.js - A page which is supposed to display multiple tripsummaries generated by the user.
- Fulltrip.js - contains the entire trip. Can be reached currently by clicking 'more info' from the home page. Displays the following:
  - Activityitemfull.js : Displays a mapping of multiply activities.
  - Accommodationitem.js: Displays a mapping of multiple accommodations (current example only shows 1).

- RestaurantItem.js: Displays the restaurants that are part of the trip.

## Contributions by Founder

- James Desjardins - Created mainpage.js, simplegenerate.js, leftsidebar.js, made changes to app.js, and server.js.
- Vlad Emelyanov - Created modal.js, activityitem.js, tripsumdb.js, sidebar.js. Made contributions to app.js (made router work with side and navbars) and server.js (created a method that is meant to display 3 'tripsummary' items in the pop-up modal)
- Alexander Sullivan - Wrote server.js methods that properly wire up activityitemfull.js, accommodationitem.js, and restaurantitem.js to the fulltrip.js. Solved issues with mock reset button and app.js that held team back from completing project.
- Matthew Cassano - Created user.js component for the Edit Profile Page and also contributed functions to server.js and contributed to the database.
- Graham Hagenah - Created customized.js
- Sean Callahan - Created the original tripsummary.js, contributed to the database, and attempted to create usergeneratedpage.js

## Cuts

- Removed comments and comment threads (for this project).
- Removed re-generate button for fulltrip page.
- Removed load more button from tripsummary lists on mainpage and usergeneratedpage
- Less info contained in a user profile
